AEROSAVE

Fully synthetic, fulfills higher requirements in corrosion protection, than AeroSynth 2 and AeroSynth Competition (see product information AeroSynth 2).

Description

AeroSave is a synthetic oil with an intensified additive package thus giving long term corrosion protection even in engines working under extreme or unfavourable conditions, especially in 4 stroke engines.

AeroSave is the advancement of our *AeroSynth 2*, which proves its outstanding properties since more than 15 years.

With high sophisticated additives we succeeded to reduce the combustion residues even with a higher portion of additives.

AeroSave is capable to neutralize the aggressive acids caused by combustion, even with up to 20 % Nitromethane. This gives corrosion protection for a longer storage period.

Application

AeroSave can be applied same as *AeroSynth 2* and is especially recommended for engines with a high risk of corrosion caused through their construction or through application, especially 4 stroke engines, Multi-cylinder engines, a. s. o.

With precious model engines and fuel with a lower part of lubricant and/or high percentage of Nitromethane you should also use *AeroSave*.

Preservation

Special conservation of the model engine is not necessary with *AeroSave* when the engine was running for about 2 minutes before the cut off with $\frac{3}{4}$ of speed and if the engine is stopped by cutting the fuel line. However, you have to pay attention that during transport there will be no flow-back of residues out of the silencer to the engine.

If additional conservation is required, just drip some cubic centimetres (approx. half cubic capacity) *AeroSave* pure through the carburettor. Turn engine then without glow plug with the electro starter for a short time.

AeroSave is incompatible with mineral oil.

The above information is supplied to the best of our knowledge and belief on the basis of the current state-of-the-art and our own development work. Subject to amendment.
